

# Remote Access Policy

|                |                   |
|----------------|-------------------|
| Document ID    | NCS-REM-004       |
| Owner          | IT Infrastructure |
| Version        | 1.8               |
| Effective date | 2026-06-20        |
| Classification | Internal          |

## 1. Scope

This policy governs remote access to NexaCore Solutions systems from home networks, customer locations, public networks, and while traveling.

## 2. Approved Access Methods

Corporate VPN is required to access internal administrative tools, internal databases, and private engineering environments. SaaS applications approved for direct internet access do not require VPN unless their application owner specifies otherwise.

Only company-managed devices that are encrypted, compliant with endpoint security controls, and enrolled in device management may connect to the corporate VPN.

## 3. Public and Untrusted Networks

Employees may use hotel, airport, and cafe networks only when the device firewall is enabled and the corporate VPN is connected before accessing internal resources.

Users must avoid unknown USB charging stations and must not disable endpoint protection to resolve connectivity problems.

## 4. International Travel

Access from outside the employee home country is permitted only after submitting a Travel Access Request at least two business days before departure. High-risk destinations may require a loaner device or may be denied remote access.

If an employee is already abroad and access is blocked, they must contact the Service Desk. They must not use consumer VPN services to bypass geographic controls.

## 5. Idle Sessions and Disconnects

VPN sessions disconnect after 30 minutes of inactivity. Users may reconnect after completing MFA. Continuous sessions may be terminated for maintenance, security investigation, or device non-compliance.
