

VPN Troubleshooting Guide

Document ID: NCS-OPS-003 | Scanned copy | Internal

1. Before You Start

This runbook is for employees using a company-managed laptop and the approved NexaConnect VPN client. Personal devices are not supported.

- Confirm that normal internet access works before troubleshooting the VPN.
- Verify the laptop date, time, and time zone are correct. Incorrect system time can cause certificate or MFA validation failures.
- Confirm the user can complete MFA. Never approve an unexpected MFA prompt.

2. Authentication Failed

- Stop repeated attempts after four failures. Five failed sign-in attempts within 15 minutes can trigger a temporary account lockout.
- Open the Self-Service Access Portal and verify the account is active. If the password was recently changed, sign out of the VPN client and sign in again.
- If the user cannot sign in to the Self-Service Access Portal, contact the IT Service Desk for identity verification and account recovery.

Security warning: repeated unexpected MFA prompts or a password you did not change may indicate credential compromise. Deny the prompt, reset the password, and report the event.

3. VPN Connects but Internal Sites Do Not Load

- Disconnect and reconnect the VPN once. Confirm the client status shows Connected and a corporate VPN address is assigned.
- Test the internal status page. If public websites work but multiple internal services fail, capture the VPN diagnostic bundle and open a P2 ticket if several users are affected.
- Do not disable the endpoint firewall or endpoint protection as a troubleshooting step.

4. Connection Drops Frequently

- Test from a stable network. Weak Wi-Fi or captive-portal networks can interrupt the tunnel.
- VPN sessions may disconnect after 30 minutes of inactivity according to the Remote Access Policy. This is expected behavior.
- If the issue continues on a stable connection, collect the client diagnostic bundle and include the approximate disconnect times in the ticket.

5. Travel and Geographic Blocks

If access is blocked while traveling internationally, do not use a consumer VPN or proxy to bypass the restriction. Contact the Service Desk and provide the Travel Access Request number.

6. Escalation Data

Include user name, asset tag, VPN client version, current location country, error message, issue start time, and the diagnostic bundle when available.
